

md-pdf-converter

Uses the [markdown-pdf](https://www.npmjs.com/package/markdown-pdf) (<https://www.npmjs.com/package/markdown-pdf>) 3rd party node module to convert md files to a pdfs.

Current markdown-pdf CLI interface usage:

Usage: markdown-pdf [options] <markdown-file-path>
--

I want to extend this module and create a module that converts all md files within the current directory into pdf files (if the respective pdf already exists... then overwrite).

If possible I would be able to set a watch method that on a directory executes the conversion when a new markdown file is added/created.

Why?

I can have all of my recent study notes that I've created in markdown readily available on my mobile as pdfs to for easy review by using dropbox to sync the conversion folder.

This new module will be intended to be installed globally so that when running the command 'convdir' all '.md' files in the current directory will be converted.
